SYSTEMA SOLARE ET PLANETARIUM

ex hypothesi Copernicana secundum elegantissimas Illustrissim[i] [H]ugenij deductiones novissime collectum & exhibitum

a IOHANNE BAPT. HONNO NORIBERGÆ. Cum Privilegio Sac. Cæs. Majestatis.

Magnitudines corporum Planetariorum respectu Solis Geometrice exhibitæ.

Saturnus

Sol

Iupiter

Mercurius Venus Tellus Mars

Typus macularum, et Planetarum Facies diversæ.

Memoranda Solis Eclipsis totalis

Benevole Spectator

Innumerabilem Fixarum exercitum, ipsas pusillo schemate tibi consideradū proponimus, quæ non, nisi opaca Planetarū corpora, mutuatitiis Solis lumine, sed innata sibi luce totidem Soles radiant, suis quoque admixtis Solis nostri, haud dubie Planetis, quibus radies suos impertiantur, circumdatæ, non enim frustra illas a Creatore potestas esse arbitramur. At distantiam, a planetario systemate etiam aliqua proportione metiri, nec numerus nec area ulla nobis suppeteret. Nam perpendē, qualem in suo Cosmotheoro Hugenius argumenti satis probabilibus deduxit eam quippe distantiæ Telluris a Sole habere rationem, qualis est unitatis ad 27664. ut proinde globus terrementarius, qui ex Tellure nostra explosus Solem elapsis 25 annis fere attingeret, ad stellam Sixty Fixarum proximam, non nisi spatio annorum 691600 (percepta horrendum!) pertingeret. Orbem igitur Magnum ad distantiam a Fixis punctī tantum habere rationem, omnino necesse est.

SATURNUS cum satellitibus suis circumeundo Solem, periodum absolvit anni 29 h. 174 horis 5. Incalat Saturni (a quæ fiat, quod verisimillimum arbitramur) [illegible] planetis primarijs non nisi Iovem spectant, cæteris Sol nimium exilis apparet. Quæ si Saturnicolis idem est, quod nobis Venus. Notandum ultimum [illegible] a Sole Saturnicolis idem esse, ut globus tormentarius, qui nobis Venus. Notandum ultimum [illegible] ab ipso Saturno ex Saturno [illegible] tam, magnam esse, ut globus tormentarius, qui nobis Venus. Notandum ultimum [illegible] ab ipso Saturno ex Saturno [illegible] artorie pulsibus experientia [illegible] ferretur, ham. 600 pedes conficit, hac ipsa celeritate [illegible] ad Solem vix annis 250 ferretur, ham. distat 1117⁸ Diamet. Terræ indies metia. [illegible] fere 2912258⁴0 Mill. Germ.

SATURNI quinque SATELLITES ab ejus centro distant diametris annuli Saturnum ambientis

Primus 0 4/5 diam. annuli fere 30 1/2 diam. ☉
Secundus 4 1/2 fere 42 diam. ☉
Tertius 2 1/4 fere 58 diam. ☉
Quartus 4 fere 134 diam. ☉
Quintus 24 fere 396 diam. ☉

Horum ordine quartum Hugenius in Hollandia omnium primus detexit An. 1654. reliqua a Cassino Parisijs 1ⁿ et 4ⁿ an. 1684. 3ⁿ an. 1686. 1ⁿ an. 1671 reperit.

QUATUOR IOVIS SATELLITES, qui Tellure nostra [illegible] nec minores sunt, distant a centro Iovis ut infra.

Primus 2 1/2 diamᵗʳ Iov. fere 42 diam. ♃
Secundus 4 1/2 fere 67 diam. ♃
Tertius 7 1/2 fere 107 diam. ♃
Quartus 21 1/2 fere 298 diam. ♃

Annis 12 mens. 5

Quæ Saturnum, Iovem, Martem, Venerem, Solem, Lunam, Terram, Mercurium, Cometas, Fixas, Nebulosas, Lacteum circulum, Maculas Solares, Phases Veneris, Annulum Saturni, Satellites Iovis, Saturni, Lunæ, Terræ, Phases Mercurij, Parallaxin Solis, Aberrationem Fixarum, Motum Solis, Lunæ, Nodorum, Apsidum, Inclinationem Orbium, Eclipses Solis, Lunæ, Satellitum

Annuli ♄ ad Diametr.

Ex hypothesi Terræ distantia 1750 mill. Germanicorum erit diam.

Diam. ☾ est 2171 mill. Germ: ideo Tellure minor 4 vicibus quam prox: Distantia med. 30. diam. ☉ sive 51600 mill. Ger.

Quatuor IOVIS SATELLITES circa Tellurem nostram

SATURNUS cum satellitibus suis circumvertit sub Solem periodum annis 29 d. 174 horis 5. Incolæ Saturni (si qui sint, quod Veri simillimum est arbitramur) e planetis primariis non nisi Iovem spectant, cæteris Soli nimium vicinis, nec ex tanta distantia discernendis. Iovem spectant 37 gradus a Sole non recedit. Hinc Saturnus magnam, et valentibus ipsis quod nobis Iovis, sed semper lucidi, nec ullius ab Sole tam magnam, et valentibus ipsis quod nobis Iovis. Notandum ulterius, planetam, ultimo arterie positu, experientia testa, 850 ferme semidiametros suas, quæ simplici horæ secundi vel ad Solem. vix annis 250 ferretur. Iam distat 1111760 Diametr. sive 191225840 Mill. Germ.

SATURNI quinque SATELLITES ab ejus centro distant diametris annuli Saturnium ambientis

Primus ○ 3/8 diam. annuli sive 32 1/2 diam. ○
Secundus 4 1/2 sive 41 1/2 diam. ○
Tertius 2 1/2 sive 58 diam. ○
Quartus 6 sive 224 diam. ○
Quintus 18 sive 530 diam. ○

Horum ordine quartum Hugenius in Hollandia omnium primus detexit 1684; reliqua a Cassino Parisijs 1st et 2d ann. 1684. 3tium an. 1079. 4tum an. 1091. reperit.

Memoranda SOLIS ECLIPSIS totalis 22. May 1706 alicubi inveniendam, cum mora trium et amplius minutorum conjuncta, cujus tractum, retrogradi, peramœnum, Eurumque usque Asiam ubi planeta, diaphano nondum, hac de causa Orbis sphæ mole, diæ partes ac radii, Veris cum Vita brev. tempor. Mensis proximo, repræsentabile, ostendimus.

Benevole Spectator

Innumerabilem EIXARUM exercitum ysthoc pusillo schemate tibi consideradii proponimus, quæ non, veluti opaca Planetarii corpora mutuatitie Solis lumine, sed innata sibi luce totidem SOLES radiant: suas quoque admittat Solis nostri haud dubie Planetas, quibus radios suos impertiantur, circumdatæ, non enim frustra illuc a Creatore positas esse arbitramur. At distantiam, a planetarie systemate etiam aliqua proportione metiri, nec numerus, nec area ulla nobis suppeteret. Nam perpende, qualem in suo Cosmotheoro Hugenius argumentis satis probabilibus deduxit eam quippe distantiæ Telluris a Sole habere rationem, qua Sol ipse ad 27684. ut proinde globus terrimentarius, qui ex Tellure nostra explosus Solem elapsis 25 annis fere attingeret, ad stellam Sixty Eixarum proximam, non nisi spatio annorum 691600 (perceptu horrendum!) pertingeret. Orbem igitur Magnum ad distantiam a Eixie puncti tantum habere rationem, omnino necesse est.
